

PrimeGrid's 27121 Prime Search

On 11 October 2018, 22:54:34, PrimeGrid's 27121 Prime Search, through PRPNet and in collaboration with the 12121 Search (k=27 sister project), has found the mega prime:

$$27 \cdot 2^{7046834} + 1$$

The prime is 2,121,310 digits long and will enter Chris Caldwell's "The Largest Known Primes Database" (<http://primes.utm.edu/primes>) ranked 48th overall.

The discovery was made by Andrew M. Farrow of Australia using an Intel(R) Xeon(R) CPU E3-1245 v6 @ 3.70GHz Processor with 16GB RAM, running Linux. This computer took about 1 hour 13 minutes to complete the primality test using LLR.

The prime was verified internally.

Credits for the discovery are as follows:

1. Andrew M. Farrow (Australia), discoverer
2. PrimeGrid, et al.
3. Srsieve, sieving program developed by Geoff Reynolds
4. PSieve, sieving program developed by Ken Brazier and Geoff Reynolds
5. LLR, primality program developed by Jean Penné

Entry in "The Largest Known Primes Database" can be found here:

<https://primes.utm.edu/primes/page.php?id=125683>

PrimeGrid's 27121 Prime Search is a collaboration with the 12121 Search, which was established on 5/24/2004 to search for large primes of the form $121 \cdot 2^n - 1$. Later, on 3/1/2005, they added k=27 to their search. Their "short term" goal is to search for n up to 10M. PrimeGrid added the +1 form and searches both k's and forms together.

Fermat number divisibility (including generalized and extended) was checked by OpenPFGW using the following settings: -gxo -q $27 \cdot 2^{7046834} + 1$. For more information about Fermat and generalized Fermat number divisors, please see Wilfrid Keller's sites:

- <http://www.prothsearch.com/fermat.html>
- <http://www.prothsearch.com/GFNfacts.html>

Generalized and extended generalized Fermat number divisors are as follows:

$27 \cdot 2^{7046834} + 1$ is a Factor of xGF(7046830,10,3)

$27 \cdot 2^{7046834} + 1$ is a Factor of xGF(7046832,11,5)

Using a single PC would have taken years to find this prime. So this timely discovery would not have been possible without the thousands of volunteers who contributed their spare CPU cycles. A special thanks to everyone who contributed their advice and/or computing power to the search - especially all the sievers who work behind the scenes to make a find like this possible.

The 27121 Prime Search will continue to seek even larger primes. To join the search please visit PrimeGrid: <http://www.primegrid.com>

PrimeGrid's 27121 Prime Search

About PrimeGrid

PrimeGrid is a distributed computing project, developed by Rytis Slatkevičius and currently managed by Iain Bethune, James Breslin, Scott Brown, Ulrich Fries, Michael Goetz, Roger Karpin, Rytis Slatkevičius, and Van Zimmerman.

PrimeGrid utilizes BOINC and PRPNet to search for primes with the primary goal of bringing the excitement of prime finding to the "everyday" computer user. Simply download the software and let your computer do the rest. Participants can choose from a variety of prime forms to search. With a little patience, you may find a large or even record breaking prime.

BOINC

The Berkeley Open Infrastructure for Network Computing (BOINC) is a software platform for distributed computing using volunteered computer resources. It allows users to participate in multiple distributed computing projects through a single program. Currently BOINC is being developed by a team based at the University of California, Berkeley led by David Anderson.

This platform currently supports projects from biology to math to astronomy. For more information, please visit BOINC: <http://boinc.berkeley.edu>

PRPNet

PRPNet is a client/server application written by Mark Rodenkirch that is specifically designed to help find prime numbers of various forms. It is easily ported between various OS/hardware combinations. PRPNet does not run each PRP test itself, but relies on helper programs, such as LLR, PFGW, phrot, www, and genefer to do the work.
